

Connecting radios all over the world

Remote control your Damm Tetra system

Damm Tetra base station

SoftRadio with both radios and Damm talkgroups

Mimer SoftRadio is a system to remote control two way radios over LAN, WAN or the Internet. The operator uses a standard Windows PC, with the SoftRadio software, and standard audio accessories.

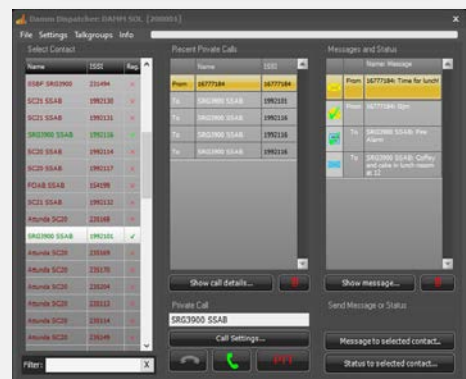

Each operator can handle many talkgroups and many operators can handle the same Tetra system.

The remote control option for the Damm Tetra system includes not only audio and PTT functions but also talk group change, SDS messaging, private calls, DGNA and emergency handling.

The system allows for mixing of other radio types at the same operator, so that also analogue or digital radios can be controlled. Also phones and intercoms can be operated from the same PC GUI.

Optionally all audio can be recorded and calls can be cross patched between standard radios and the Tetra system.

Other radio types can also be controlled from the same operator software.
